

Acne Treatment with PDT
Before and After Two & Three Treatments

Photodynamic Therapy (PDT) with Levulan is the “Accutane Alternative” in that the treatment offers a potential long-term control or a cure with a much lower side effect profile. PDT is also less expensive and more convenient than the 20 week course of Accutane oral therapy. A PDT treatment course includes a four week topical and oral skin preparation, followed by monthly treatment sessions for three treatments. Each treatment session is followed by a 24 hour period of strict indoor sun-avoidance. Another treatment option that can offer substantial long-term control and/or a cure includes the Smoothbeam laser system.
